Threat Report [TI-20261105-001] CVE-2026-111497 (Node2Shell): Node.js Brotli decoder RCE, exploited in the wild (+Patch, +Workaround, +Detection)

by Switch CERT

Status	Advisory
Severity	High (vendor rating)
Threat Type	Vulnerability
Identifier(s)	Not available yet. Node.js will publish the CVE IDs with the release.
Score / Rating	Vendor rating: HIGH
Observed in the wild	Unknown
Public exploit / tooling	Unknown
First release	2026-11-05, 12:30
Last Update	2026-11-05, 12:30
TLP	CLEAR

Affected assets, platforms and versions

- Node.js 26.x, 24.x and 22.x, all versions before the 2026-11-11 release
- All End-of-Life release lines (25.x, 23.x, 20.x and older). The Node.js project does not supply a fix for these lines.

Description

The Node.js project will release security updates for 26.x, 24.x and 22.x on 2026-11-11 or a short time after. The highest severity in each release line is HIGH. The project does not give technical details, CVE IDs or the number of vulnerabilities before the release.

Impact

The impact is not known yet. End-of-Life versions will stay vulnerable after the release.

Advisory

1. Find Node.js

If you use Microsoft Defender XDR, use the query that follows. It shows the Node.js installations, their support status and a priority. Run the query in Defender XDR Advanced Hunting. Microsoft Sentinel does not contain this table.

```
DeviceTvmSoftwareInventory
| where SoftwareName contains "node.js" or SoftwareName contains "nodejs"
| extend MajorVersion = toint( extract(@"^v?(\d+)", 1, SoftwareVersion))
| extend SupportStatus = case(
    MajorVersion == 26, "Active LTS",
    MajorVersion in (22, 24), "Maintenance LTS",
    MajorVersion == 27, "Alpha",
    MajorVersion in (25, 23, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6,
5, 4, 0), "End of Life",
    "Unknown")
| extend PatchReadiness = case(
    SupportStatus == "End of Life", "Migration required - No official security patches",
    MajorVersion in (22, 24, 26), "Supported - Apply November 11 security update",
    MajorVersion == 27, "Alpha - Review unsupported production deployment",
    "Review manually")
| extend Priority = case(
    SupportStatus == "End of Life", 1,
    MajorVersion == 27, 2,
    MajorVersion in (22, 24, 26), 3, 4)
| project DeviceName, SoftwareVendor, SoftwareName, SoftwareVersion, MajorVersion,
SupportStatus, PatchReadiness, Priority
```

The query shows only the devices that are onboarded to Defender for Endpoint. It does not show Node.js in applications or in containers.

2. Upgrade End-of-Life versions now

End-of-Life versions will not get a fix. Upgrade them to 26.x. If this is not possible, upgrade them to 24.x. Do not upgrade to 22.x. The End-of-Life date of 22.x is 2027-04-30.

The current versions of 22.x, 24.x and 26.x also fix CVE-2026-111497 (Node2Shell). Attackers exploit this vulnerability now. Refer to TI-20261105-001.

3. Plan the update for 2026-11-11

If you use a supported version (22.x, 24.x or 26.x), plan the update for 2026-11-11. Install the update when it is available. Then restart the Node.js processes and build the container images again.

Switch CERT will update this report when the details of the release are available.

Threat Indicators

Not applicable. No details are available before the release.

Timeline

- 2026-11-05: Switch CERT publishes TI-20261105-002 v1.
- 2026-11-11: Planned Node.js security release for 26.x, 24.x and 22.x.
